

ONE KNOB SILICON TRANSISTOR FUZZ

There are farm songs and there are pirate songs. Set sail for skullduggery on the high seas with Gold Tooth Fuzz.

Based on the discontinued Walrus Audio Contraband circuit the Gold Tooth Fuzz is a one knob fuzz capable of big *velcro* fuzz tones and plenty of sustain when you turn it up.

Turn your guitar volume pot down and it refuses to clean up. Instead, it spits like a foul-mouthed privateer cursing their dying battery and grasping for a synth.

You will also find lots of Bass friendly tones in this box as well.

GOLD TOOTH FUZZ

Controls:

Main knob... turn up the volume. Clockwise for more. Nice and simple.

Switch... flick the switch to toggle between two different bass responses. Use it to tame humbuckers or beef up single coils. There are no rules though. Play around with it to see what works with your pickups.

Power: 9V centre negative power supply

Current: ~3.2 mA

Always use a good quality isolated power supply.
